4. – In Java you must declare variables before using them. what does it mean

To declare a variable in java means to initialize a data type to a name or an identifier which when attached to a data type tells the program what type of data and the name of the variable.

5. Write one line of code showing how to declare an integer variable named number.

 int number=Integer.pareseInt(scanner.nextLine());

6. What happens if you store the user's name in a variable declared as an integer?

If you store a user's name in a variable declared as an integer when ran/open it will display an error indicating wrong data type used.
